

# Development of Centralized Data Platform for a Real Estate Company

**Company Name:** AlloyTower Inc.

**Location:** San Francisco, California, USA

**Founded:** 2012

# Company Overview: **AlloyTower Inc.**

Founded in 2012, AlloyTower Inc. aimed to transform the real estate and rental markets through technology and data-driven solutions. Initially a local agency, it quickly recognized market fragmentation and inefficient property discovery.

The company pivoted to integrate machine learning, real-time data analytics, and automated tools, becoming a leader in advanced solutions for property owners and tenants.

# Market Presence & Core Services

## Market Presence

AlloyTower operates nationwide in the US, serving major metropolitan areas like San Francisco, Los Angeles, New York, and Chicago. Its diverse customer base includes residential buyers/renters, commercial developers, and real estate agents.

## Core Services

**Real Estate Marketplace:** Online platform for residential and commercial listings.

**Property Management:** Automates listing updates, inquiries, and rent payments.

**Market Insights & Analytics:** Real-time pricing, demand, and availability data.

**Smart Property Search:** AI-powered personalized recommendations.

**AlloyTower Mortgage:** Integrated mortgage pre-approval and loan offers.

# The Business Problem We're Solving

The real estate industry struggles with fragmented data, inefficient discovery, and lack of transparency. Buyers, renters, and agents face outdated listings, leading to delays and poor experiences. Manual processes reduce operational efficiency, and real-time market insights are often missing.

## Poor Data Quality

**67%** of real estate transactions are delayed due to poor data quality and fragmented systems.

## Manual Processes

**56%** of agents waste time on manual tasks like listing management and inquiry tracking.

# Current State: Fragmented & Inefficient

Property data is scattered across platforms, hindering discovery and management. Buyers and renters struggle to find suitable properties, while owners and agents battle manual workflows. Lack of system integration means no real-time market insights, preventing data-driven decisions.

## Current Pain Points:

- **Fragmented Data**  
Information spread across third-party platforms and internal systems.
- **Manual Processes**  
Listing management and inquiries handled manually, causing delays and errors.
- **Lack of Real-Time Insights**  
Limited access to market trends, pricing, and demand analysis.

# Our Solution: Integrated Real Estate Platform

We are implementing an integrated real estate platform that centralizes property listings and real-time market data into a single, automated system.

This solution automates listing management, streamlines inquiries, and provides real-time market analytics. It enhances property discovery through advanced filters and personalized recommendations based on real-time data, empowering agents, buyers, and sellers to make informed decisions.

# Key Features of the Platform

## Centralized Data Hub

Aggregates property listings, inquiries, and market insights into one place.

## Automated Management

Reduces manual processes for listings and inquiries, minimizing errors and delays.

## Real-Time Market Insights

Provides up-to-date pricing trends and demand analytics for informed decisions.

# Project Scope (3-weeks)

| Workflow                              | Project Managers                        | Business Analysts                          | Data Analysts                     | Data Scientists                    |
|---------------------------------------|-----------------------------------------|--------------------------------------------|-----------------------------------|------------------------------------|
| Phase 1: Design & Development         | Oversees development, ensures timelines | Finalize BRD, align with business needs    | Define data requirements          | Design ML models, data predictions |
| Phase 2: Go-Live & Deployment         | Manages go-live, monitors deployment    | Validate core functionality, lead training | Validate data insights for UAT    | Ensure ML models are optimized     |
| Phase 3: Documentation & Presentation | Leads final report & presentation       | Final documentation, prepare final report  | Provide insights, lessons learned | Document ML models, insights       |
